Virtual 3D Art Gallery Web Application

Project Overview

The **Virtual 3D Art Gallery Web Application** is an interactive web-based platform that allows users to explore artworks in a simulated three-dimensional gallery environment. The application recreates the experience of visiting a physical art gallery by enabling users to navigate through a digital exhibition space and view different artworks in an immersive way.

The goal of this project is to combine **web development and 3D visualization technologies** to create an engaging platform where users can explore paintings, sketches, and artwork collections through an interactive virtual environment.

Problem Statement

Traditional art galleries require physical presence, which limits accessibility for many people. A virtual gallery provides an alternative solution where users can experience exhibitions from anywhere using a web browser. This project aims to create a digital platform that replicates the gallery experience through interactive 3D visualization.

Technology Stack

Frontend Development - HTML5, CSS3, JavaScript
3D Rendering - WebGL, Three.js
User Interface Design - CSS Animations, Responsive Design
Graphics & Visualization - 3D Models, Texture Mapping
Tools & Environment - VS Code, GitHub

Methodology

1. Interface Design

- The structure of the gallery interface was created using HTML5.
- CSS3 was used to design the layout, styling, and responsive user interface.

2. 3D Environment Setup

- A virtual gallery environment was created using WebGL and Three.js.
- The 3D scene included elements such as gallery walls, floors, and lighting.

3. Artwork Integration

- Artwork images such as paintings and sketches were added as textures mapped onto 3D surfaces.
- Each artwork was positioned strategically within the virtual gallery space.

4. Navigation Implementation

- JavaScript was used to implement interactive navigation controls.
- Users can move through the gallery and explore artworks from different viewing angles.

5. Rendering and Interaction

- The WebGL rendering engine continuously updates the 3D scene to ensure smooth interaction.
- User actions such as mouse movement or keyboard input control navigation within the gallery.

Key Features

- Interactive virtual gallery environment
- 3D visualization of artworks
- Smooth navigation through gallery space
- Display of paintings, sketches, and digital art
- Responsive and user-friendly interface

Output

The application provides a simulated art gallery experience where users can explore artworks interactively within a 3D environment, similar to walking through a physical exhibition space.
